SUBSCRIPTION TRACKER

DOCUMENTATION

This automation was aimed at helping the owner of the gym in tracking the subscriptions of his members and helping him to send a notification to those members whose subscription is almost coming to an end.

The workflow begins with Schedule trigger which runs on every 3rd week at 8pm which fetches all member details from Fit Life member record sheet and maps raw sheets columns to readable data on a list through a set node connected to a code node using java script which counts the number of days since joining and asset node attaches each member with their concurrent active days since they subscribed.

An IF node is then placed to separate the members who have had an active subscription for more than 30 days and those with less where those with more than 30 days on true path were described as old members and the rest on false path as new members. The old members are then passed through a set node to map the details of those subscribed members and into a code node which tags members as active/subscribed then prepares a field for subscription and a split-out node calculates the duration inside that plan.

This subscription is mapped on an append sheet that catches data of the old members having an active subscription then fed into input 1 of a merge node. Meanwhile the new members are mapped on a set node where their information is captured in a new members google sheet whose output is fed into input 2 of the merge node.

An IF node receives input from the merge node and validates that the members having less than 10 days in a subscription require a message. A set node is placed to acquire details of the members to be reminded about their subscription completion and an email is sent to them through the Gmail node
