TOTAL REVENUE CALCULATOR

DOCUMENTATION

This automation was created to act as the Gym owners' financial assistant where it calculates the active member subscriptions depending of the version, and sends a summary of the total monthly revenue to him via email.

The workflow begins with a schedule trigger that runs every first day of the month at 8am. Members' information is then fetched from a member list sheet and fed to asset node that defines the type of membership followed by an IF node to validate if the subscription is actually premium or not.

Those that are true are manually identified by the set node and counted by the summarize node and fed to the AI Agent which generates the total revenue accrued from 12,000 premium subscriptions. A set node then maps the total number of premium subscriptions and revenue made and feeds it to input 1 of a merge node.

Meanwhile the standard membership that falls on the false path heads to a set node that maps the standard Membership is priced at 8,500 and a summarize node counts the number of memberships and a set node outputs the count . An AI Agent then calculates the total amount generated from the standard memberships and a set node counts the total number of standard subscriptions and revenue made.

This information is then added to the merge node through input 2 and an AI Agent sums up the total revenue from the standard and premium subscriptions and then maps the output on a google sheet for the gym owner to review.
