WEEKLY ROUTINE AND MEAL SUGGESTIONS

DOCUMENTATION

The workflow presented is an automated weekly workout routine reminder. It is meant to come up with recommendations of which workouts should be done in a certain week depending on the exact client and their workout goals.

The workflow begins with a schedule trigger that wakes up after every one week at 8AM to begin the automation. Information is then fetched from the Sheets that the Fit Life Gym has mapped its routines, a set node then maps the information of the routines (“Day”, “Training Focus”, “Recommended Workout”, “Food Before Workout” and “Recovery notes”).

The first AI Agent then drafts a professional summary of the recommended workouts and the second AI Agent creates a HTML version of the summary provided. A set node then maps the details of the weekly routines and an aggregate node is placed to present the information into a single list.

The weekly plans are fetched by sheet node which keys in the output to a merge node through input 1 while input 2 is fed by another sheet holding the details of the gym members. The members’ information and routines are mapped on a set node before an email being sent to the members through Gmail.
